What is big data?

Big data (Wiki)

Big data is a broad term for data sets so large or complex that traditional data processing applications are inadequate.

What is considered "big data" varies depending on the capabilities of the users and their tools, and expanding capabilities make big data a moving target.

- To study big data, one may focus on analyzing important data sets, and deduce useful information and decisions.
- Alternatively, one may focus on some learning and creating techniques in handling large data set.

・ 同 ト ・ ヨ ト ・ ヨ ト

- In quantum information science, one uses quantum states and properties to store, transmit, and process information.
- To transmit and process information, qubits will go through quantum channels or operations.

A Basic Problem

Given two quantum states ρ_1, ρ_2 and a certain quantum operation or channel Φ , how similar and how different can ρ_1 and $\Phi(\rho_2)$ be?

イロト イポト イヨト イヨト

• Quantum states are represented as $n \times n$ density matrices, i.e., positive semi-definite matrices with trace one, say, $\rho = \frac{1}{2} \begin{pmatrix} 1 & i \\ -i & 1 \end{pmatrix}$.

回下 イヨト イヨト 三日

Distance measures for quantum states

- For two numbers a, b, we can measure the distance between them by |a b|.
- For two matrices / quantum states ρ_1, ρ_2 , we can measure the distance between them by a norm
- There are different kinds of norms on matrices. For example, the operator norm ||X||_{oper} = max{||Xv|| : v ∈ Cⁿ, ||v|| = 1},

the trace norm $||X||_1 = tr |X|$, and Frobenius norm $||X||_F = tr (X^*X)^{1/2}$.

• A norm $\|\cdot\|$ on M_n is unitary similarity invariant (USI) if

 $||UXU^*|| = ||X||$ for any $U, X \in M_n$ such that U is unitary.

イロト 不得 トイラト イラト 二日

Theorem [Li,Pelejo,Wang]

Let $\|\cdot\|$ be a USI norm, $\rho_1 = U\begin{pmatrix}a_1 & & \\ & \ddots & \\ & & a_n\end{pmatrix}U^*, \rho_2 \in M_n$ be density matrices, where U is unitary and $a_1 \geq \cdots \geq a_n$. Suppose ρ_2 has eigenvalues $b_1 \geq \cdots \geq b_n$.

 be a USI norm, $\rho_1 = U\begin{pmatrix}a_1 & & \\ & \ddots & \\ & & a_n\end{pmatrix}U^*, \rho_2 \in M_n$ be density matrices, where U is unitary $a_1 \geq \cdots \geq a_n$. For unital channels Φ

• $\max \|\rho_1 - \Phi(\rho_2)\|$ occurs at $\Phi(\rho_2) = \rho_1 = U \begin{pmatrix} b_n \\ & \ddots \\ & & b_1 \end{pmatrix} U^*$, and • $\min \|\rho_1 - \Phi(\rho_2)\|$ occurs at $\Phi(\rho_2) = U \begin{pmatrix} d_1 \\ & \ddots \\ & & d_n \end{pmatrix} U^*$,

where (d_1, \ldots, d_n) is determined by the following algorithm:

Step 0. Set $(\Delta_1, \ldots, \Delta_n) = \lambda(\rho_1) - \lambda(\rho_2)$. Step 1. If $\Delta_1 \ge \cdots \ge \Delta_n$, then set $(d_1, \ldots, d_n) = \lambda(\rho_1) - (\Delta_1, \ldots, \Delta_n)$ and stop. Else, go to Step 2.

Step 2. Let $2 \leq j < k \leq \ell \leq n$ be such that

$$\Delta_{j-1} \neq \Delta_j = \dots = \Delta_{k-1} < \Delta_k = \dots = \Delta_\ell \neq \Delta_{\ell+1}.$$

Replace each $\Delta_j, \ldots, \Delta_\ell$ by $(\Delta_j + \cdots + \Delta_\ell)/(\ell - j + 1)$, and go to Step 1.

Here are two examples illustrating the algorithm in the theorem.

Example 1 Let $\rho_1 = \frac{1}{10} \text{diag}(4,3,3,0)$ and $\rho_2 = \frac{1}{10} \text{diag}(3,3,3,1)$.

Apply Step 0:

Set $(\Delta_1, \ldots, \Delta_4) = \frac{1}{10} \operatorname{diag} (4, 3, 3, 0) - \frac{1}{10} \operatorname{diag} (3, 3, 3, 1) = \frac{1}{10} \operatorname{diag} (1, 0, 0, -1).$
